

**Q1.** Write a program in python to open a UDP socket between a client and a server, then use wireshark to monitor the packets sent. [Hint: Write a small program for the UDP client side and another for the server side. Use parts of the code in your book pages 159-164]. Include in the message your name, and the city of your birth place. Use port number that is the last 4 digits of your UFID. Explain the address and port numbers used.

Ans.1 =

Python script for UDP Server & UDP Client.

UDPServer.py

```
1 from socket import *
2 serverPortNumber = 5826
3 serverSocketVar = socket(AF_INET, SOCK_DGRAM)
4 serverSocketVar.bind(('', serverPortNumber))
5 print ('The server is ready to receive')
6 while True:
7     message, clientAddress = serverSocketVar.recvfrom(2048)
8     changedMessage = message.decode().upper()
9     serverSocketVar.sendto(changedMessage.encode(), clientAddress)
```

UDPClient.py

```
1 from socket import *
2 serverNameIdentifier = '127.0.0.1'
3 serverPortNumber = 5826
4 clientSocketVar = socket(AF_INET, SOCK_DGRAM)
5 inputSentence = input('Input lowercase sentence:')
6 clientSocketVar.sendto(inputSentence.encode(), (serverNameIdentifier, serverPortNumber))
7 changedSentence, serverAddress = clientSocketVar.recvfrom(2048)
8 print ('Response From Server:', changedSentence.decode())
9 clientSocketVar.close()
```

## Running python Script →

- ① = first UDPserver.py is run.
- ② = secondly UDPclient.py is run.
- ③ = Input is given as lower case sentence (myname + Birth place)
- ④ = Server Returns output as upper case sentence.

```
~/Desktop/Computer Networks/LAB 2 — python UDPServer.py
```

```
[(base) Vikass-MacBook-Pro:LAB 2 vikas$ python UDPServer.py  
The server is ready to receive
```

```
~/Desktop/Computer Networks/LAB 2 — -bash
```

```
[(base) Vikass-MacBook-Pro:LAB 2 vikas$ python UDPClient.py  
Input lowercase sentence:vikas chaubey tikamgarh  
Response From Server: VIKAS CHAUBEY TIKAMGARH  
(base) Vikass-MacBook-Pro:LAB 2 vikas$
```

wireshark tracer the activity . $\Rightarrow$

① = request is sent to Server.

Apply a display filter ... <%>

**Q3.** Show the ARP table of your machine and describe it.

Ansr.3 =

Running command = "arp -a" on terminal  
to obtain the arp table.

```
[base] Vikass-MacBook-Pro:LAB 2 vikas$ arp -a
? (169.254.21.195) at 64:5d:86:bf:2a:ed on en0 [ethernet]
? (192.168.0.1) at 8:36:c9:c7:c7:c3 on en0 ifscope [ethernet]
? (192.168.0.13) at 30:fd:38:a0:5c:a6 on en0 ifscope [ethernet]
? (192.168.0.14) at 64:5d:86:bf:2a:ed on en0 ifscope [ethernet]
? (192.168.0.15) at a4:83:e7:aa:b7:f2 on en0 ifscope permanent [ethernet]
? (192.168.0.255) at ff:ff:ff:ff:ff:ff on en0 ifscope [ethernet]
? (224.0.0.251) at 1:0:5e:0:0:fb on en0 ifscope permanent [ethernet]
? (239.255.255.250) at 1:0:5e:7f:ff:fa on en0 ifscope permanent [ethernet]
(base) Vikass-MacBook-Pro:LAB 2 vikas$ █
```

Arp table Explanation = "arp -a" command  
displays arp cache  
table for all interfaces.

①= The first column of the arp table describes the Hostname , if the hostname can't be resolved then a question mark (?) is printed.

- ② = The second column gives the IP address of the interfaces. Given IP address 192.168.0.1 represents the local interface.
- ③ = The third column represents the physical MAC address of the interface.
- ④ = The fourth column (Ex. en0) represents the interface identifier, in this case en0 is the only ethernet adapter which is started
- ⑤ = The fifth column (Ex. ifscope) represents the "Route command" Ex - Here the route command is ifscope. It is used to bind a route to a specific interface. In this case ifscope identifies that IP addresses are routed to en0 adapter.

⑥ = The sixth column (Ex. permanent) represents the "arp cache entry state". There are two types of cache entries states -

① = Static Arp cache entries =

These entries are manually added to the cache table and are kept in the cache on a permanent basis.

② = Dynamic Arp cache entries =

These entries are created by the software itself as a result of successfully completed part ARP resolution. These entries are kept in the cache only for a period of time and then removed.

In our case "permanent" means entry is static Arp entry.

⑦ = The Seventh column (Ex. ethernet)  
represents Hardware type - in  
our case its ethernet adapter.

**Q4.** Show the mac addresses for the interfaces of your machine and the ip addresses using ifconfig (or ipconfig), and the routing tables using netstat (or other) commands.

Ans-4 = ①= Running command "ifconfig" ↳

```
(base) Vikass-MacBook-Pro:LAB 2 vikas$ ifconfig
lo0: flags=8149<UP,LOOPBACK,RUNNING,PROMISC,MULTICAST> mtu 16384

(base) Vikass-MacBook-Pro:LAB 2 vikas$
```

② = Running command "netstat"

**Q5.** Extra points (optional): suggest up to three related ‘original’ experiments (each with up to three short well-defined tasks) to use networking tools or commands to understand socket programming, UDP, TCP, MAC, IP addresses, or ARP/routing tables. Make them clear, brief and include short sample answers. Label them clearly as well (1. a, b, c. and 2. a, b, c, 3. ....). Provide references and/or websites as appropriate.

Awr-S = Since I am using MacOS , hence usage of network commands is different from windows & linux machines.

①= **netstat command** is used to obtain list of open sockets i.e. Active internet connections.

a)= "**netstat -g**" : This command displays information associated with multicast connections (related to IP address clashing)

b)= "**netstat -anv TCP**" = This command return only TCP connections on the MAC OS device.

c) = "netstat -apv UDP" = This command returns only UDP connections on the MAC OS device.

Reference =

<https://www.lifewire.com/using-netstat-command-on-mac-4176069>

② = Arp command can be used to display and modify Arp cache entries.

a) = "arp -d [Ip address]" = with this command we can delete the specific Ip address from the arp cache table .

b) = "arp -d -a" = with this command we can delete all the entries in arp table.

c) = "arp -s [Ip address] [MAC address]" - using this command we can add an entry manually to the arp cache table.

<https://krypted.com/mac-os-x/using-the-arp-command/>

③ = **Traceroute Command** = Traceroute is a network diagnostic tool used to track in real time the pathway taken by a packet on an IP network from source to destination. It reports the IP addresses of all the routers pinged in between it also records the time taken for each hop the packet makes from source to destination.

a) = "traceroute -m [Max IP address]"  
This command can set the max time to live (max number of hops) used in outgoing probe packets. The default is 30 hops.

(b) = "trace route [Host IP] [PacketSize]"

This command could be used to increase probe datagram length, by default it is 38 bytes.

(c) = "trace route -s [src address]" =  
with this command the given IP address could be used as source address in outgoing probe packets. This feature could be used on hosts with more than one IP address, a source address could be forced to be something other than IP address of interface packet it sent on.
